

Abstract

Method and system for ordering, loading and using admission tickets for access to access-controlled service devices (3), in which admission tickets are
5 ordered from a reservation center (4) through transmission of order data via an order channel, the order data comprising the call number of a mobile communications terminal (1) to which the ordered admission tickets are transmitted via a mobile network (6) and are stored there in a memory module (21). The data exchange between this memory module (21) and a reading
10 device (31) of a said service device (3) takes place over a contactless interface (13). Decisions about the access authorization of the user of the said communications terminal (1) are made, for example in the reading device (31) or in the communications terminal (1), taking into account the ticket information contained in the said admission ticket, for example limited to a digitally signed
15 ticket number or with indications about the respective service device, and, in accordance with the decision, access to the service device (3) is given or denied to the user through an access device (32) connected to the said reading device.
